

HIPAA Business Solutions for Healthcare

Delivering a return-on-investment from HIPAA

HIPAA does not have to be an onerous non-productive use of capital for a healthcare enterprise. Although HIPAA mandates security, contractual relationships and transaction processing requirements that are new and complex, these requirements can serve as the foundation for improved ROI in a healthcare organization.

Smart enterprises realize accurate information can result in accurate decisions, and that there are many ways to leverage information resources: new products, new markets, more efficient ways of doing business: locally and nationally.

Working with PricewaterhouseCoopers, **PERSEID** Software has developed a Life Sciences Database that can be applied to improving administrative processing, cash flow and clinical capabilities:

- ❖ Satisfy the legal and functional requirements mandated by HIPAA
- ❖ Redefine business and contractual relationships so that the business workflow is known for HIPAA
- ❖ Store and manage standard ANSI transactions
- ❖ Merge financial and clinical data into *one* repository
- ❖ Manage all contracts, claims, clinical and administrative data in a single HIPAA Repository
- ❖ Respond easily to patient and member requests for data

Key Results:

- ❖ Business has a workflow foundation that software can improve
- ❖ Cash management and cash flow improvement
- ❖ Faster claims processing and payment
- ❖ No more lost or misplaced transactions
- ❖ Finally link clinical, administrative and financial data into a useful form
- ❖ Secure, auditable interactions with customers, partners, patients and members

Delivering solutions for the Life Sciences & Healthcare

With decades of experience in strategy, requirements and healthcare solutions using premier implementation partners such as PwC worldwide, **PERSEID** serves clients across healthcare and life sciences market segments by providing them with the solutions and knowledge they need to make critical business decisions using HIPAA as a tool to improve their business. Using software to:

- ❖ Define organizations, contracts, flow of control and the relationships among key “entities” in your business
- ❖ Link documents and claims to persons, organizations and create relationships that model your business
- ❖ Build links from claims data to clinical data, contracts and documents
- ❖ Use audit trails to know what is happening to transactions, patients, customers and other key entities
- ❖ Get a data repository as a natural consequence of managing your data and their new relationships
- ❖ Build clinical solutions from your data and improve patient and partner communications
